

ANAEROBIC TOILETS

As well as the need for a UDDT (see PePo©) which would be an off-the-shelf-purchase, we recognise the need for an affordable and ecologically viable anaerobic toilet that communities or local artisans can build for themselves. If you or your organisation have the build plans for such a toilet system we would greatly appreciate it if you could share; we in turn would share that information for free online and help to spread the word amongst community leaders, especially in S.E. Asia where we are based. The system needs to be cheap n easy to build and hygienic to use. We are looking for an enclosed system that doesn't require emptying, where the processed waste may be used for agriculture after secondary treatment.
